

Konstantin Alikhanov.

Backend / Full-stack Engineer — Go, TypeScript, AI

Tbilisi, Georgia · Remote · Full-time / Part-time / B2B

Hands-on backend and full-stack engineer with 14 years of experience building and operating production products end to end. Main stack: Go, TypeScript/JavaScript, PostgreSQL and MongoDB. Built high-load event pipelines processing up to 1 million events per minute, search and analytics systems, B2B SaaS products, integrations and deployment infrastructure. Strong in production debugging, legacy modernization and turning ambiguous product needs into shipped features. I prefer an individual-contributor role and remain hands-on with architecture, coding, testing and operations.

SKILLS

Go, TypeScript, JavaScript, Node.js, React, PostgreSQL, MongoDB, ClickHouse, Elasticsearch, Redis, Kafka, NATS, AWS, Docker, Kubernetes, CI/CD, REST APIs, Microservices, LLM integrations, AI-assisted development, Python

SELECTED IMPACT

The B2B SaaS product I built grew to approximately 10,000 customers and was later acquired, and the event-processing infrastructure behind it handles up to 1 million events per minute and approximately 100,000 tracked visitors per day. The logistics platform I worked on supports around 30,000 vehicle transfers per year, and the POS software I wrote is deployed across more than 35 physical locations.

EXPERIENCE

Founding Engineer / Co-Founder

Banyan AG · Jul 2025 — Apr 2026

Co-founded an AI automation product for small businesses and stayed the primary hands-on engineer throughout the project — I designed the architecture and wrote most of the production code across backend services, LLM workflows, infrastructure and third-party integrations. The AI-enabled workflows I built connected business processes with the tools customers already used, and I owned delivery end to end: product discussions, implementation, deployment, production debugging and iteration.

Senior Product Engineer / Technical Lead

Pulserio AG · LeadRebel · May 2020 — Apr 2025

Built LeadRebel, a B2B lead-generation SaaS, from scratch and helped grow it to around 10,000 customers before its acquisition by Leadinfo. I developed the product end to end — tracking script, Go backend services, event pipeline, search, analytics, admin tools, integrations and deployment infrastructure — and designed and operated a pipeline processing up to 1 million events per minute and approximately 100,000 tracked visitors per day. In a small team I stayed hands-on across backend, frontend and infrastructure while making product and architectural decisions, and much of that work was investigating and resolving performance and reliability issues that appeared only under real production traffic.

Web Developer

App3null GmbH · Oct 2016 — May 2020

Developed the web platform used to manage vehicle-transfer logistics after the company secured a major Volkswagen contract, implementing order uploads, dispatching, search, status tracking and the driver and contractor workflows around them. I helped scale it to an operation handling around 30,000 vehicle transfers per year; the system remains in production and was later commercialized as a SaaS product for other logistics companies.

.NET Developer

Business Software Consulting Ltd. · Dec 2011 — Sep 2016

Built a point-of-sale system end to end, from requirements and implementation to rollout and production support; it is used across Bank of Georgia SOLO lounges and the Degusto restaurant chain, covering more than 35 locations. I also developed ERP functionality and integrations for clients including Tegeta Motors, working directly with real business operations and supporting software used daily by non-technical staff.
